

Concept Maps

Click on the icons underneath the concepts to browse linked resources

Creating a Concept Map

- Identify the Central Question or Topic
- Generate Concepts (consider the “W” questions: who, what, why, how, when, where, etc.)
- Organize Concepts
 - ✓ Examples
 - ✓ Definitions
 - ✓ Functions
 - ✓ Properties
 - ✓ Roles
 - ✓ Results
 - ✓ Processes

Creating a Concept Map

- Put concepts that don't fit into the map into a "parking lot" to re-consider later
- Link concepts together with lines explaining interaction/relationship between the concepts
- Reorganize as needed throughout the process

Let's Create Concept Maps

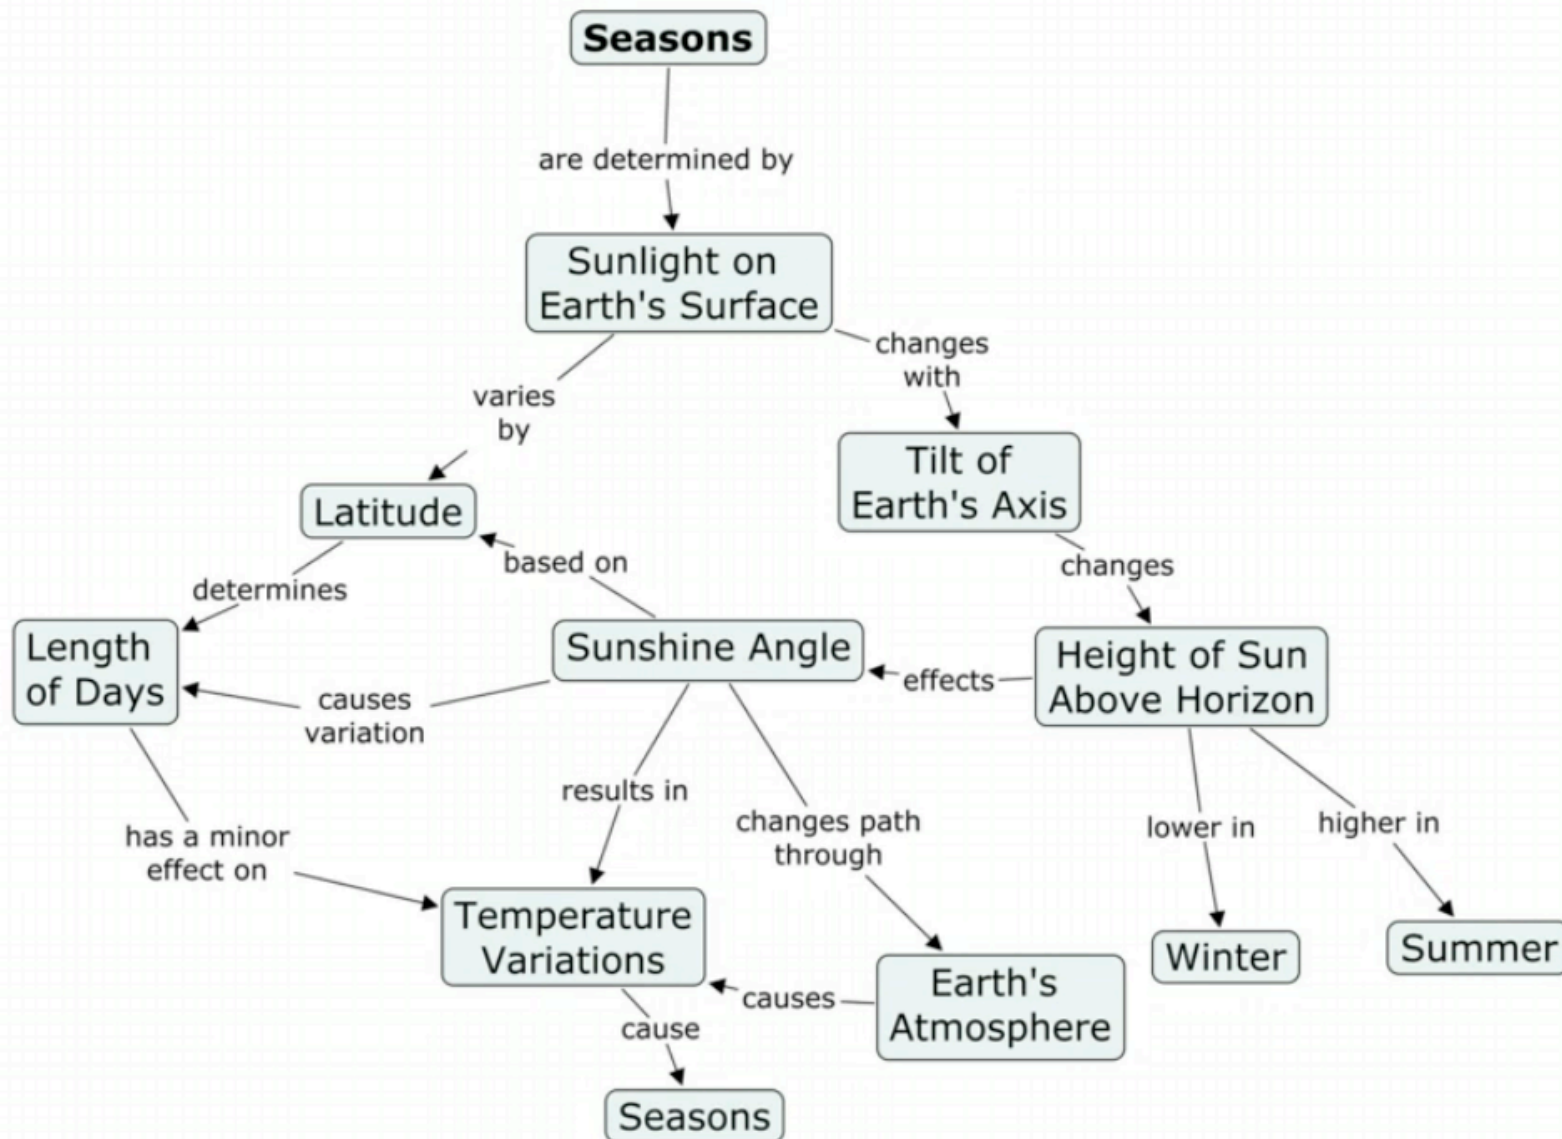

- Question: Why is it colder in the winter than in the summer?
- Key Concept: Seasons

"Skeleton Map" example

Why is it colder in the winter than in the summer?

Why is it colder in the winter than in the summer?

Links

- Links represent relationships between concepts
- Keep them short (a few words)
- Concepts and their links should form a sentence (e.g., “_____ is a subset of _____” or “_____ results in _____”)
- Possible relationships: defined as, opposite of, discovered by, can be divided into, is greater than, caused by, etc.

Central Question

- Create a focus question that clearly specifies the issue addressed by the concept map
- Simple maps are based on objects and are descriptive (e.g., "What is water?")
- Maps dealing with events or processes generate more elaborate representations (e.g., "How does water change from a solid to a liquid?")
